

Revenue Operations

RevOps Performance Analyst

Technical Challenge Exercise

Time investment: 5 to 8 hours	Return within: 5 working days
-------------------------------	-------------------------------

Confidential. For interview purposes only.

01 Why this challenge exists

This role is not a reporting role.

The RevOps Performance Analyst at Pleo owns the data infrastructure GTM runs on. You build what does not exist, fix what is broken, spot where revenue is being lost, and tell the CRO/GTM Leadership what to do about it.

This challenge tests three things:

1. Do you work with messy, incomplete data without hand-holding?
 2. Do you think commercially, not just technically?
 3. Do you turn data into a decision, not just a chart?
-

02 The Scenario

The weekly GTM performance review is in 48 hours. The CRO, VP of Sales, RevOps, and Finance will be in the room.

You have access to seven raw data tables in the Excel workbook. The data is not production-clean. Some fields are inconsistently named. Some records require a judgment call. Your job is to join these tables, build a working model, run your analysis, and produce outputs that give leadership a clear picture of where the business stands and what to do next week.

Are we on track to hit the quarter ARR target? Where are we ahead or behind the plan? What is driving the gap? Which regions, segments, or demand sources need attention this week? Which pipeline risks require leadership action? What should the business do next?

What we value most is the quality of your conclusions, not the sophistication of your code. We expect practical insight that changes what leadership does on Monday morning.

For example: a strong recommendation does not say 'Pipeline by segment.' It says: 'DACH Mid-Market has 14 open deals totalling 312K EUR that have had no AE activity in 30 or more days. Based on a historical win rate of 28% in this segment, re-engaging these accounts this week generates an estimated 87K EUR in new ARR within 45 days. Owner: Regional Sales Lead. Action: Pipeline review call by Friday.'

That is the level of specificity expected.

03 Your files

You receive two files. Both are required.

File	Format	Purpose
Pleo_RevOps_Challenge_Brief.pdf	pdf	This document. Read it fully before opening the Excel file.
Pleo_RevOps_Challenge_Databases.xlsx	Excel	Seven raw data sheets, a Data Dictionary, and an Assumptions tab. All your analysis starts here.

What is inside the Excel file

Tab	Approx. rows	What it contains
Accounts	~30	Company master data. Region and segment naming is inconsistent across rows.
Opportunities	~60	Deal records. Contains one duplicate set and inconsistent stage and demand source labels.
Pipeline Snapshots	~120	Weekly pipeline cuts. The same opportunity appears across multiple weeks. Use to track stage movement and aging.
Funnel Events	~100	Lead and funnel event log. Demand source labels differ from the Opportunities table.
Sales Targets	~25	Monthly ARR targets by rep, region, and segment.
Rep Roster	~12	Rep master data. One rep changed teams mid-period. One rep is ramping.
Activity Data	~100	Call, email, and meeting logs. Some outcome fields are missing.

The data quality issues are intentional. Part of the exercise is deciding how to handle them and documenting those decisions.

04 Your task

Your task has four parts. Label all files: **Surname_Firstname_RevOps**.

Part 1. Define your data model

- Write out the schema for how these seven tables would relate in a production data warehouse such as BigQuery
- Name your primary keys, foreign keys, and relationships for each table
- Document any assumptions you made when resolving naming conflicts or missing joins

- A written schema is enough. A diagram is not required

Part 2. Build a dashboard for the VP of Sales

- The dashboard is for the VP of Sales. It lets them monitor rep attainment, pipeline health, and funnel conversion without opening a spreadsheet
- Options include: a Looker Studio dashboard, a Python-generated HTML report, an Excel dashboard with live formulas, or equivalent
- The output must connect to your analysis. It shows the same data that supports your deck
- Show it running. A screenshot without the underlying file or code does not count

Part 3. Build your deck

- Create a five-slide PowerPoint deck. **Your audience is the CRO and VP of Sales. They are not technical**
- Lead each slide with a finding, not a chart title
- Every recommendation includes a euro value and a timeframe

Part 4. SQL queries and Python script

- SQL should join at least two tables and be written in BigQuery-compatible standard SQL
- Python should clean, transform, or validate the data
- Both should be commented and reproducible

AI usage log (if applicable)

If you used Claude, ChatGPT, Gemini, or similar, include a short log: tools used, prompts written, what each produced, where AI saved time, and where you made the judgment call yourself. AI use is welcome. The analysis is yours.

What you decide

We leave room for your judgment. There is no single right answer.

- Which insights you lead with and how you structure the narrative.
- Which tools you use. Python, SQL, BigQuery, Excel, Claude, ChatGPT. Anything.
- How you handle the data quality issues you find.
- How you identify the automation opportunity. There is at least one obvious one in this dataset. Find it.

If you find something we did not point you to, include it. That is the point of this challenge.

Return within 5 working days. If timing is difficult, let us know and we will agree on a workable timeline. Send all files to your Pleo recruiting contact.

05 What good looks like

This challenge is here to see how you **think, build, and communicate** when the data is not perfect.

A strong submission shows us you can take messy GTM data and turn it into something the business can use. You connect the tables, clean the inputs, document your assumptions, and make your work easy to follow.

The **best answers do not stop at “what happened”**. They **explain what it means, where revenue is at risk, where there is upside, and what should happen next**.

Your deck should help the CRO and GTM leadership make a decision. Your dashboard should help the VP of Sales run the business. Your SQL, Python, and data model should show how you got there.

We value practical, focused work. The strongest submissions show clear thinking, strong judgment, and outputs that would be useful on Monday morning.
